

Spend Platform Workflow

DATA INTEGRATION

Uniform data management principles – Integrate the data from multiple sources

Setting Rules for Data: Have built-in rules to prevent bad data from entering the system.

Checking for Errors: Automatically look for mistakes like negative amounts or missing information.

Central Data Management: Keep a master list of vendors and categories to ensure everyone uses the same information.

Removing Duplicates: Use smart algorithms to find and merge duplicate transactions.

User Feedback: Make it easy for you to report adjustments when needed.

Handling Multiple Languages: We can process data in different languages and translate it into one language for easier analysis.

DATA ENRICHMENT & ANALYSIS

Standardizing Data: Make sure all dates, currencies, and units are consistent, no matter where the data comes from.

Supplier Normalization: Standardize supplier names and information, consolidating variations into a single, consistent vendor record.

Data Classification to Taxonomy: Classify spend data according to a taxonomy, enabling structured analysis and reporting.

Adding More Detail: Enrich data with your own internal data (material master, vendor master, site master, cost center/department master, and chart of accounts data) to give you a fuller understanding of your business operation.

Flexible Rule Creation: Users can request any adjusts to the data processing rules at any time to fit specific categories.

Self-Service Data Augmentation/Creation: Users have the ability to augment existing data or create new datasets as needed, without needing to rely on IT or vendor support.

Data Governance: Have clear rules and responsibilities for managing data.

DATA INSIGHTS & VALUE
